

CASE STUDY

PROWALL

AT

CARNEITHEN

WHITESANDS

Located on the exposed coastal tip of the St David's Peninsula overlooking the magnificent Whitesands Bay in Pembrokeshire Coast National Park, this property seamlessly blends modern with the unusual. ProWall provides the durable rendered rainscreen for this timber frame, protecting it from the extreme elements, driving rain and strong winds.

ProWall benefits from extensive testing for wind loading and has a BBA certificate with a 60-year durability lifecycle, the first of its kind for a rendered rainscreen cladding system. ProWall was the perfect choice to satisfy the demanding requirements of this eye-catching property. Flowing effortlessly with the waved zinc roof and angular lines of the Velfac windows, ProWall provides both form and function. In a commitment to our excellent customer service and guarantee procedure, our technical team

conducted site visits to sign off the installation at 4 main stages; batten installation, board & bead installation, basecoat application and final completion of the top coat. This is a standard we aim for with all ProWall systems installed by our trained applicator network. For more information about our services and how ProWall or one of our other render systems can work for your development, please contact our team or visit our website. www.sas-europe.com
